

Child with diabetes in kindergarten

Name: _____

Department: _____

Date of birth: _____

Diabetes is a chronic medical condition caused by a lack of insulin, which results in high blood sugar if untreated. Insulin is delivered by an insulin pump worn on the outside of the child's body, or is injected via a pen device.

Hypoglycaemia (low blood sugar) or a «hypo» occurs if the child has taken too much insulin or not eaten enough.

Severe hypoglycaemia – insulin shock – the child is unconscious

- Phone 113 – they will guide you further
- Place the child in the recovery position (on their side, with head tilted back and knees bent)
- Phone parents/guardians
- To prevent further insulin delivery, the pump can be removed from the body.

NEVER give insulin for a hypo.

Relevant staff should keep the parents'/guardians' phone number on their own mobile:

Name: _____

Phone number: _____
